

Fig 3d. Regulon swap dilutes Hif1a's ULM signal (explains #1 -> #12)

Per-target WT_heat t-statistic by membership. The CollecTRI-only targets the swap ADDS carry high |t| but MIXED sign (their box straddles 0), so they cancel and add little net directional signal -> diluting the mor-weighted regulon mean and dragging the Hif1a ULM score below the tighter DoRotheA value.
