

UpSet view: both empty intersections are drawn as zero, not left out

Corroborates the membership answer: 198 of 213 WT_heat_up genes are in neither curated lens.
Bars are intersection sizes over the same three sets; the two zero-height bars are labelled rather than omitted.

Dots mark which sets each bar belongs to; the left bars are the three set sizes. Every combination of the three sets gets a column, so an intersection with no genes appears as a zero-height bar labelled 'empty' rather than as a missing column. Set membership only: a lens enriching is a separate measurement from that lens being contained in WT_heat_up.
