

The projected WT and cGAS-KO up arms share 182 of 235 human genes

Question — does thresholding and ortholog projection separate the heat response by genotype? Answer — no. The two up arms overlap at Jaccard 0.774 and the two down arms at 0.630, so their enrichment scores from one ranked list are not independent. The Interaction gates are disjoint from both.

Counts are read from the frozen one-symbol-per-line signature files. Open diamond marks a set that is structurally empty rather than measured and small.
Claim tier: a direct count over frozen sets.
