

Where each arm's genes sit relative to the enriched GO BP terms

Every gene of every arm lands in exactly one of three classes against the 12986-symbol projection background. The tick inside each bar is the median coverage of 2000 gene sets matched to that arm on annotation depth, and the p beside the bar is the share of those draws covering as many genes as the arm does. Coverage is a count of genes the enriched terms touch, and a gene is counted once however many terms hold it.
