

cGAS-dependence of the heat response: ISG arm vs HIF/glycolysis arm

Per-group mean log2(CPM+0.5); lines connect 37C→39C within genotype. Interaction adj.P annotated per gene (* = adj.P < 0.05).

PROVISIONAL – inferred sample mapping (Hspa1b/Hsph1 thermometer + Cgas), pending collaborator sample sheet

Direction labels rest on the marker prior (KO lowers Cgas; heat raises HSPs), pending sample sheet.

n=5/group; the Interaction is the lowest-powered term -- a non-significant HIF interaction means NO DETECTABLE cGAS-dependence at n=5, NOT proof of independence.
