

Fig 3n. The heat-shock regulator Hsf1 is co-elevated with HIF on heat

Hsf1 (purple) is significantly UP on all three heat-MAIN contrasts (Temp_main 3.20, padj 0.015), co-elevated w axis (Hif1a +5.14 / Epas1 +4.17, orange) -- not foregrounded earlier in this analysis. Same decoupleR-ULM es fig3a/fig3c (cross-quotable). * = BH padj < 0.05. Co-elevation only: NOT a claim that Hsf1 causes or outranks
