

Fig 3l. A heat-induced glycolytic/stress program partially overlapping HIF targets

Hif1a's positive WT_heat 'activity', re-bucketed by curated biological module (signed contribution = $\text{sign}(\text{mor}) \times t_{\text{wt}}$, copied from fig3g -- no recomputation). Heat-shock/stress UP, shared/glycolytic UP, feedback UP, but the HIF1a-selective hypoxic-survival core (Pdk1/Bnip3/Bnip3l/Car9) is REPRESSED (left of zero). NOT a canonical hypoxic-HIF output.
