

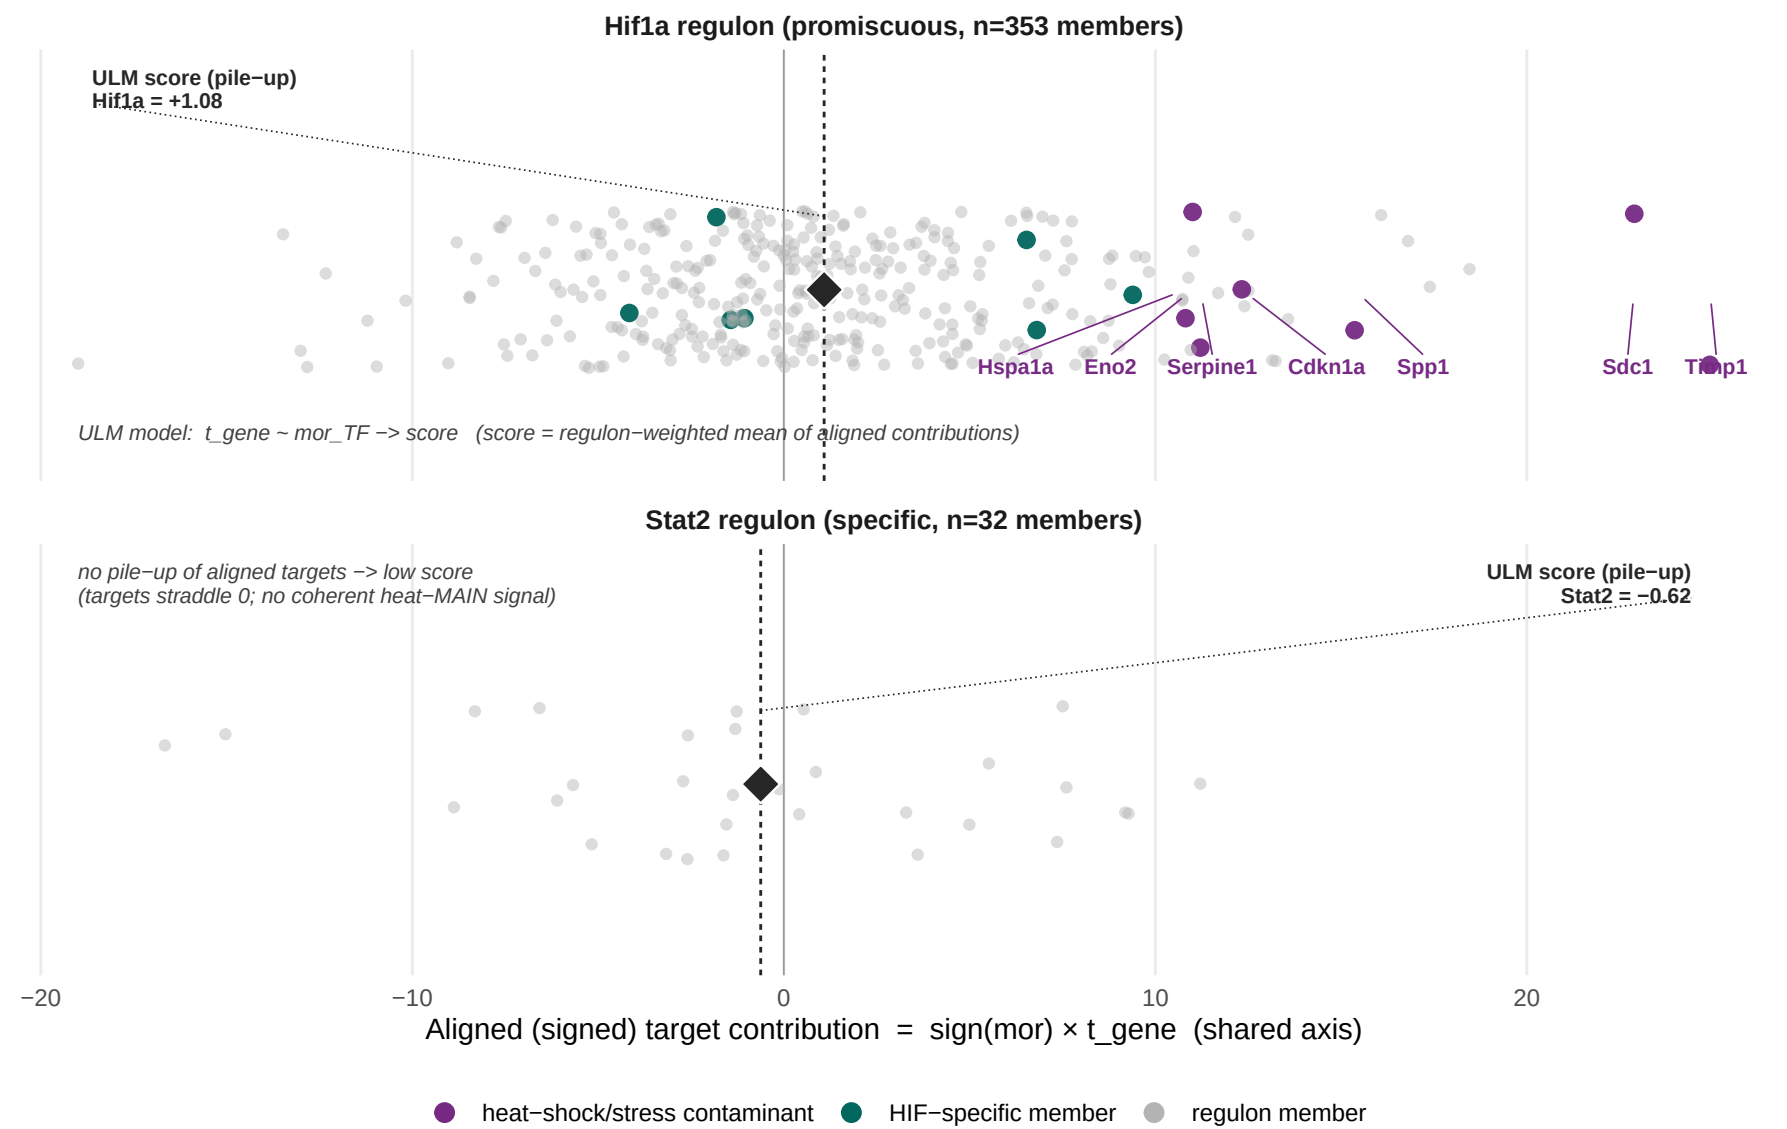

Fig 3m. How decoupleR-ULM nominates a TF: the score is the regulon's pile-up

A broad (promiscuous) regulon scores high off any high-|t| members it happens to contain -- here generic heat-shock/stress genes (purple) push the Hif1a pile right, scoring a heat-induced glycolytic/stress program that partially overlaps HIF targets. A small, specific regulon (Stat2) only piles up when its OWN targets coherently move -- on this contrast they do not.

PROVISIONAL – inferred sample mapping (Hspa1b/Hsph1 thermometer + Cgas), pending collaborator sample sheet
