

Fig 3n. The heat-shock regulator Hsf1 is co-elevated with HIF on heat-MAIN (CollectTRI ULM)

Hsf1 (purple) is significantly UP on all three heat-MAIN contrasts (Temp_main 3.20, padj 0.015), co-elevated with the HIF axis (Hif1a +5.14 / Epas1 +4.17, orange) -- not foregrounded earlier in this analysis. Same decoupleR-ULM estimator as fig3a/fig3c. * = BH padj < 0.05. Co-elevation only: NOT a claim that Hsf1 causes or outranks HIF.
