

UpSet view: both empty intersections are drawn as zero, not left out

Bars are intersection sizes over the same three sets; the two zero-height bars are labelled rather than omitted.

Dots mark which sets each bar belongs to; the left bars are the three set sizes. Every combination of the three sets gets a column, so an intersection with no genes appears as a zero-height bar labelled 'empty' rather than as a missing column. Human counterpart after ortholog projection: 2 of 199 WT_heat_up genes fall in the curated HSR core. Conditioning either curated lens on the other moves NES by about +0.005. Set membership only: a lens enriching is a separate measurement from that lens being contained in WT_heat_up. HSR_core is a curated stress-response reference; read human fever-cause language as unsupported.
