

# WT\_heat rank positions for the gate output and two curated lenses

The WT\_heat signed-t ranking contains 19,679 genes; the shaded band is the empirical span of the export gate.

Each point is one gene; ridgelines show density along the same rank-percentile axis.  
Shaded band = empirical gate span; only 213 of the first 2,010 ranked genes passed because logFC >= 1 was also required.
