

Fig 3h. Provenance / hypoxia control: a field-consensus and a hand-made HIF list both

Field-consensus Lombardi-100 and hand-made Phylo-16 both go UP with heat in BOTH genotypes (Interaction NS for both) -- a hypoxia/provenance check that the hand-made Phylo list isn't idiosyncratic, NOT thermal-HIF proof. CAVEAT: each metagene COLLAPSES HIF1/HIF2 and is DIRECTION-BLIND -- it cannot see the repressed hypoxic core (Pdk1/Bnip3/Bnip3l/Car9; fig3l). * = BH padj < 0.05; ns otherwise.
